# [How-To] Install AMP on Debian 12

## Purpose

This document aims to install AMP on Debian 12 VM or LXC.

## Prerequisites

List of prerequisites:

- Root user or sudo user
- Debian 12 LXC or VM

## Amp Installation Instructions

### Step 1: Set the Time on the Server

Amp Relies on the server having network time services active and working. Run the following command to set the time zone correctly:

```
dpkg-reconfigure locales && locale-gen
```

Walk through the on-screen options and configure them to your environment's needs.

### Step 2: Install AMP

Run the following command to start the interactive amp installation:

```
bash <(wget -qO- getamp.sh)
```

This will run in the command line and allow you to configure the initial server. Select the options that suit you.

## Step 3: Initial Config in UI

Once the terminal install is done, it will tell you to go to a browser and go to the server's local IP and port 8080 like this:

```
http://192.186.1.10:8080
```

There, you will finish the installation by determining server type, security settings, and apply your AMP License.
