[How-To] Delete CT Manually in Shell

Purpose

Manually delete CT via the proxmox node shell.

Prerequisites

List of prerequisites:

- Root user for Proxmox Node
- CT in Proxmox

Deleting the LXC container with the pct tool

Proxmox VE provides the pct command to assist with container actions. In this case, we will use this:

```
pct destroy 107
```

This command where the number is the CT number assigned to it. Please refer to this:

```
man pct
```

For more detailed instructions.

If you get an error with this check the error output with this:

```
cat /etc/pve/lxc/107.conf
```

If the LXC is locked, it will not work. Refer to the unlock page for this.
